

Hey! Nathan here, with two big new Lex features for you. *(You're getting this email because you signed up for [Lex](#), the AI-powered word processor.)*

To learn about them, [watch this video](#) or keep reading.

1. Have the AI write a first draft

When you make a new document, you can now have the AI write a first draft, create an outline for you, or just generate a list of topics that are worth considering as you write. It's a great way to get past the blank page!

2. Version history

In the top left of the document, you can now click the "Versions" dropdown to save a snapshot of the current document and its comments. You can revisit old versions at any time.

This is really handy in a few situations:

- When you start with an outline, save a version before deleting bullet points and turning them into prose.
- When you send a draft to people for feedback, save a version before they make edits and leave comments.
- When you're going through feedback you've gotten, save a version before you start resolving comments and making changes to the document.

To use these features today, [click here](#) to create a new Lex document

(Did you know you can always type "lex.new" into your browser to quickly create a new Lex doc?)

One last thing!

Do you like Lex? I'd love to hear your feedback: [Click here to fill out a 4-question survey](#).

Thank you!!
